testmysql.php

Chapter 2: PHP Basic Syntax

Example 1:

```
<!DOCTYPE html>
<html>
<head>
<title>Example1</title>
</head>

<body>
<h1>This will go as it is. </h1>

<?php
echo "This is parsed by PHP";
?>

</body>
</html>
```

```
<!DOCTYPE html>
<html>
<head>
<title>Example1</title>
</head>

<body>
<h1>This will go as it is. </h1>

This is parsed by PHP</body>
</html>
```

Example 2:

```
<!DOCTYPE html>
<html>
<head>
<title>Example2</title>
</head>

<body>
<h1>Understanding PHP Echo </h1>

<?php
echo "<ul>
<li> Honda</li>
<li> Ford</li>
<li> BMW</li>
<li> Mercedes</li>
<li> Audi</li>

</ul>";

echo "<h2>The list of cars.</h2>";
?>
</body>

</html>
```

Understanding PHP Echo

- Honda
- Ford
- BMW
- Mercedes
- Audi

The list of cars.

Example 3:

```
<!DOCTYPE html>
<html>
<head>
<title>Example3</title>
</head>

<body>
<h1>Understanding PHP Comments </h1>

<?php

/*
The following
echo statement
prints list of cars.
*/
echo "<ul>
<li>Honda</li>
<li>Ford</li>
<li>BMW</li>
<li>Mercedes</li>
<li>Audi</li>

</ul>";

// The following echo statement prints a message.
echo "<h2>The list of cars.</h2>";
```

```
?>
</body>

</html>
```

Solution:

```
<!DOCTYPE html>
<html>
<head>
<title>Exercise 2</title>
</head>

<body>
<h1>Exercise 2 Solution: </h1>

<body>
<?php
/* The following echo statement
creates first button and text box
*/
echo '<button> Button 1 </button> <input type="text"/> <br>';

/* The following echo statement
creates second button and text box
*/
echo '<button> Button2 </button> <input type="text"/> <br>';
?>
</body>

</html>
```

Chapter 3: Understanding Variables & String Functions

Example 1:

```
<!DOCTYPE html>
<html>
<head>
<title>Example 1</title>
</head>

<body>
<h1>PHP Variables</h1>

<body>
<?php

$car_name = 'Audi';
$car_price = 100;

echo $car_name;
echo '<br>';
echo $car_price;
?>
</body>

</html>
```

PHP Variables

Audi
100

```
<!DOCTYPE html>
<html>
<head>
<title>Example 2</title>
</head>

<body>
<h1>Adding two variables</h1>

<body>
<?php

$a = 5;
$b = 10;
$result = $a + $b;

echo "Result:";
echo $result;

?>
</body>

</html>
```

Adding two variables

Result:15

```
<?php
```

```
$a = 5;
```

```
$b = 10;
```

```
$result = $a + $b;
```

```
echo "Result:". $result;
```

```
?>
```

```
<!DOCTYPE html>
<html>
<head>
<title>Example 3</title>
</head>

<body>
<h1>Getting length of a string</h1>

<body>

<?php
$car_name = "Audi";
echo strlen($car_name);
$car_name = "Toyota";
echo "<br>";
echo strlen($car_name);
?>

</body>

</html>
```

```
<!DOCTYPE html>
<html>
<head>
<title>String Functions</title>
</head>

<body>
<h1>Getting words in a string</h1>

<body>

<?php
$content = "Hello how are you?";
echo str_word_count($content);
$content = "I am fine";
echo "<br>";
echo str_word_count($content);
?>

</body>
</html>
```

```
<!DOCTYPE html>
<html>
<head>
<title>String Functions</title>
</head>

<body>
<h1>Reversing a string</h1>

<body>

<?php
$content = "Hello how are you?";
echo strrev($content);
$content = "I am fine";
echo "<br>";
echo strrev($content);
?>

</body>

</html>
```

```
<!DOCTYPE html>
<html>
<head>
<title>String Functions</title>
</head>

<body>
<h1>Replacing content within a string</h1>

<body>

<?php
$content = "Hello how are you?";
echo $content;
echo "<br>";
echo str_replace("how", "where", $content);
?>

</body>
</html>
```

Solution:

```
<!DOCTYPE html>
<html>
<head>
<title>String Functions</title>
</head>

<body>
<h1>Exercise 3 Solution</h1>

<body>

<?php
$weather_info = "It is cold today";

echo "<br>";
echo strlen($weather_info);
echo "<br>";
echo str_word_count($weather_info);
echo "<br>";
echo strrev($weather_info);

?>

</body>

</html>
```

Chapter 4: PHP Operators

Operator	Name	Example	Output
+	Addition	$\$a + \b	Sum of \$a and \$b
-	Subtraction	$\$a - \b	Difference of \$a and \$b
*	Multiplication	$\$a * \b	Product of \$a and \$b
/	Division	$\$a / \b	Quotient of \$a and \$b
%	Modulus	$\$a \% \b	Remainder of \$a divided by \$b
**	Exponentiation	$\$a ** \b	Result of raising \$ a to the \$b'th power

Example 1:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 4</title>
</head>

<body>
```

```
<h1>Arithmetic Operators</h1>
```

```
<body>
```

```
<?php
```

```
$a = 50;
```

```
$b = 10;
```

```
echo $a + $b;
```

```
echo "<br>";
```

```
echo $a - $b;
```

```
echo "<br>";
```

```
echo $a * $b;
```

```
echo "<br>";
```

```
echo $a / $b;
```

```
?>
```

```
</body>
```

```
</html>
```

Arithmetic Operators

60
40
500
5

Operator	Name	Example	Output
<code>==</code>	Equal	<code>\$a == \$b</code>	Returns true if \$a is equal to \$b
<code>===</code>	Identical	<code>\$a === \$b</code>	Returns true if \$a is equal to \$b, and they are of the same type
<code>!=</code>	Not equal	<code>\$a != \$b</code>	Returns true if \$a is not equal to \$b
<code><></code>	Not equal	<code>\$a <> \$b</code>	Returns true if \$a is not equal to \$b
<code>!==</code>	Not identical	<code>\$a !== \$b</code>	Returns true if \$a is not equal to \$b, or they are not of the same type
<code>></code>	Greater than	<code>\$a > \$b</code>	Returns true if \$a is greater than \$b
<code><</code>	Less than	<code>\$a < \$b</code>	Returns true if \$a is less than \$b
<code>>=</code>	Greater than or equal to	<code>\$a >= \$b</code>	Returns true if \$a is greater than or equal to \$b
<code><=</code>	Less than or equal to	<code>\$a <= \$b</code>	Returns true if \$a is less than or equal to \$b

Assignment	Similar to	What it does
<code>a = b</code>	<code>a = b</code>	The left operand is set to the value of the operand on the right
<code>a += b</code>	<code>a = a + b</code>	Addition
<code>a -= b</code>	<code>a = a - b</code>	Subtraction
<code>a *= b</code>	<code>a = a * b</code>	Multiplication
<code>a /= b</code>	<code>a = a / b</code>	Division
<code>a %= b</code>	<code>a = a % b</code>	Modulus

Example 2:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 4</title>
</head>

<body>
<h1>Assignment Operators</h1>

<body>

<?php
$a = 50;
$b = 10;

$a += $b;

echo $a;
echo"<br>";
$a = 50;

$a -= $b;

echo $a;
echo"<br>";
$a = 50;

$a *= $b;

echo $a;
echo"<br>";
$a = 50;

$a /= $b;

echo $a;
echo"<br>";
$a = 50;

$a %= $b;

echo $a;

?>
```

```
</body>
```

```
</html>
```

Operator	Name	Example	Output
and	And	\$a and \$b	True if both \$a and \$b are true
or	Or	\$a or \$b	True if either \$a or \$b is true
xor	Xor	\$a xor \$b	True if either \$a or \$b is true, but not both
&&	And	\$a && \$b	True if both \$a and \$b are true
 	Or	\$a \$b	True if either \$a or \$b is true
!	Not	!\$a	True if \$a is not true

Operator	Name	What it does
++\$a	Pre-increment	Increments \$a by one, then returns \$a
\$a++	Post-increment	Returns \$a, then increments \$a by one
--\$a	Pre-decrement	Decrements \$a by one, then returns \$a
\$a--	Post-decrement	Returns \$a, then decrements \$a by one

Example 3:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 4</title>
</head>

<body>
<h1>Increment & Decrement Operators</h1>

<body>

<?php
$a = 45;
echo ++$a;
echo "<br>";
echo $a++;
echo "<br>";
echo --$a;
echo "<br>";
echo $a--;
?>

</body>

</html>
```

Solution

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 4</title>
</head>

<body>
<h1>Exercise 4 Solution.</h1>

<body>

<?php
$number1 = 36;
$number2 = 6;

echo $number1 + $number2;
echo "<br>";
echo $number1 - $number2;
echo "<br>";
echo $number1 * $number2;
echo "<br>";
echo $number1 / $number2;

?>

</body>

</html>
```

Chapter 5: Iteration and Control Statements

Example 1:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 5</title>
</head>

<body>
<h1>The for loop.</h1>

<body>

<?php
for($k=1; $k<=10; $k++)
{
    $output = 10*$k;
    echo "<li> 10 x".$k." = ".$output."</li>";
}
?>

</body>

</html>
```

The above piece of code will print the table of 10 on the output webpage. Have a look at the “for” loop in the above code:

```
for($k=1; $k<=10; $k++)
```

```
{  
    $output = 10*$k;  
    echo "<li> 10 x".$k." = ".$output."</li>";  
}
```

The for loop.

```
10 x1 = 10  
10 x2 = 20  
10 x3 = 30  
10 x4 = 40  
10 x5 = 50  
10 x6 = 60  
10 x7 = 70  
10 x8 = 80  
10 x9 = 90  
10 x10 = 100
```

Example 2:

```
<!DOCTYPE html>  
<html>  
<head>  
<title>Chapter 5</title>  
</head>  
  
<body>  
<h1>The while loop.</h1>  
  
<?php  
$k=1;  
while($k<=10)  
{  
    $output = 10*$k;  
    echo "<li> 10 x".$k." = ".$output."</li>";  
    $k++;  
}  
?>
```

```
</body>
```

```
</html>
```

Example 3:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 5</title>
</head>

<body>
<h1>if/else loop.</h1>

<body>

<?php

$country = "uvw";

if($country == "abc" || $country == "xyz")
{
    echo "<h2>Shipping Services Not Available</h2>";
}
else if ($country=="uvw")
{
    echo '<h2>Shipping takes 10 days. Are you willing to proceed?</h2>';
}
else
{
    echo "<h2> Your order has been placed.</h2>";
}
?>

</body>

</html>
```

if/else loop.

Shipping takes 10 days. Are you willing to proceed?

Example 4:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 5</title>
</head>

<body>
<h1>Switch Statements.</h1>

<body>

<?php

$country = "uvw";

switch ($country)
{
case "abc":
echo '<h2>Shipping Services Not Available</h2>';
break;

case "xyz":
echo '<h2>Shipping Services Not Available</h2>';
break;

case "uvw":
echo '<h2>Shipping takes 10 days. Are you willing to proceed?</h2>';
break;

default:
echo '<h2> Your order has been placed.</h2>';
break;
}

?>

</body>

</html>
```

Switch Statements.

Shipping takes 10 days. Are you willing to proceed?

Solution

```
<!DOCTYPE html>
<html>
<head>
<title>Exercise 5</title>
</head>

<body>
<h1>Exercise 5 Solution.</h1>

<body>

<?php

$output = 1;
$input=7;
$k=1;
while( $k<=$input)
{
    $output = $k * $output;
    $k++;
}
echo $output;

?>

</body>
</html>
```

Chapter 6: Understanding PHP Arrays

Example 1:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 6</title>
</head>

<body>
<h1>Arrays in PHP</h1>

<body>

<?php

$countries[0]= "USA";
$countries[1]= "RUSSIA";
$countries[2]= "CANADA";
$countries[3]= "CHINA";
$countries[4]= "ENGLAND";

$countries[]= "FRANCE";
$countries[]= "ITALY";
$countries[]= "GERMANY";
$countries[]= "SPAIN";
$countries[]= "PORTUGAL";

print_r($countries);

?>
```

```
</body>
```

```
</html>
```

Arrays in PHP

```
Array ( [0] => USA [1] => RUSSIA [2] => CANADA [3] => CHINA [4] => ENGLAND [5] => FRANCE [6] => ITALY [7] => GERMANY [8] => SPAIN [9] => PORTUGAL )
```

Example 2:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 6</title>
</head>

<body>
<h1>Using Array Keyword and Foreach</h1>

<body>

<?php

$countries = array('USA', 'CANADA', 'CHINA', 'FRANCE', 'ENGLAND');

foreach($countries as $country)
{
    echo $country."<br>";
}

?>

</body>

</html>
```

Example 3:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 6</title>
</head>

<body>
<h1>Array Traversal</h1>

<body>

<?php

$countries[0]= "USA";
$countries[1]= "RUSSIA";
$countries[2]= "CANADA";
$countries[3]= "CHINA";
$countries[4]= "ENGLAND";

$countries[]= "FRANCE";
$countries[]= "ITALY";
$countries[]= "GERMANY";
$countries[]= "SPAIN";
$countries[]= "PORTUGAL";

echo '<ul>';
for($x=0;$x<10;$x++)
{
    echo '<li>'.$countries[$x].'\</li>';
}
echo '</ul>';

?>

</body>

</html>
```

Array Traversal

- USA
- RUSSIA
- CANADA
- CHINA
- ENGLAND
- FRANCE
- ITALY
- GERMANY
- SPAIN
- PORTUGAL

Example 4:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 6</title>
</head>

<body>
<h1>Associative Array</h1>

<body>

<?php

$countries['America1'] = "USA";
$countries['Europe1'] = "RUSSIA";
$countries['America2'] = "CANADA";
$countries['Asia1'] = "CHINA";
$countries['Europe2'] = "ENGLAND";

echo $countries['Asia1'].'<br>';
echo $countries['Europe1'].'<br>';

?>

</body>
</html>
```

Associative Array

CHINA
RUSSIA

Solution:

```
<!DOCTYPE html>
<html>
<head>
<title>Exercise 6</title>
</head>

<body>
<h1>Exercise 6 Solution</h1>

<body>

<?php

$integers = array(48,15,45,65,26,78,19,35,64,76);

$largest=0;
$smallest = 0;

foreach($integers as $integer)
{
    if($integer > $largest)
    {
        $largest = $integer;
    }

    if($smallest == 0)
    {
        $smallest = $integer;
    }
    else if($integer < $smallest)
    {
        $smallest = $integer;
    }
}

echo $largest.'<br>';
echo $smallest;

?>

</body>

</html>
```

Chapter 7: Functions in PHP

Example 1:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 7</title>
</head>

<body>

<?php

function displayTagLine()
{
    echo "<h1>A Place for Top Cars </h1>";
}

displayTagLine();
    echo "<p> We sell new and used cars at a price much lower than our competitors.
<br>
    You can also rent new and used cars with or without a driver.</p>";

displayTagLine();

?>

</body>

</html>
```

Example 2:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 7</title>
</head>

<body>

<?php

function displayTagLine($message)
{
    echo '<h2>'.$message.'</h2>';
}

displayTagLine('We sell best quality cars.');
```

echo "<p> We sell new and used cars at a price much lower than our competitors.

You can also rent new and used cars with or without a driver.</p>";

```
displayTagLine('Comfortable cars for rent.');
```

?>

```
</body>

</html>
```

We sell best quality cars.

We sell new and used cars at a price much lower than our competitors.
You can also rent new and used cars with or without a driver.

Comfortable cars for rent.

Example 3:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 7</title>
</head>

<body>

<?php

function sumOfSquares($num1, $num2)
{
    return ($num1* $num1) + ($num2 * $num2);
}
echo sumOfSquares(2,3);

?>

</body>

</html>
```

Example 4:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 7</title>
</head>

<body>

<?php

$num1=10;
$num2 = 5;

echo 'Before Passing by reference:'. $num1. '-'. $num2. '<br>';
SquareByRef($num1, $num2);
echo 'After Passing by reference:'. $num1. '-'. $num2;

function SquareByRef(&$a, &$b)
{
    $a= $a * $a;
    $b = $b * $b;
}

?>

</body>

</html>
```

Before Passing by reference:10-5
After Passing by reference:100-25

Solution

```
<!DOCTYPE html>
<html>
<head>
<title>Exercise 7</title>
</head>

<body>

<?php

$integers = array(48,15,45,65,26,78,19,35,64,76);
$integers2 = array(41,25,65,47,89,12,35,4,76,98);
$integers3 = array(12,36,47,58,96,32,56,41,59,74);

processArray($integers);
processArray($integers2);
processArray($integers3);

function processArray($array)
{
    $largest=0;
    $smallest = 0;

    foreach($array as $item)
    {
        if($item > $largest)
        {
            $largest = $item;
        }

        if($smallest == 0)
        {
            $smallest = $item;
        }
        else if($item < $smallest)
        {
            $smallest = $item;
        }
    }

    echo '<br><br>';
    echo $largest.'<br>';
    echo $smallest.'<br>';
}
```

```
}
```

```
?>
```

```
</body>
```

```
</html>
```

Chapter 8: Object Oriented PHP (Part 1)

Example 1:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 8</title>
</head>

<body>

<?php

class User{
    /* Member variables */
    var $name;
        var $email;
    var $password;

    /* Member functions */
    function signUp($uname, $upassword, $uemail){

        $this->name = $uname;
        $this->password = $upassword;
        $this->email = $uemail;
    }

    function getName()
    {
    return $this->name;
    }
}
```

```
?>

</body>

</html>
```

Example 2:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 8</title>
</head>

<body>

<?php

class User{
    /* Member variables */
    var $name;
        var $email;
    var $password;

    /* Member functions */
    function signUp($uname, $upassword, $uemail){

        $this->name = $uname;
        $this->password = $upassword;
        $this->email = $uemail;
    }

    function getName()
    {
        return $this->name;
    }
}

$user1 = new User;
$user2 = new User;

$user1->signUp("Jack", "12345", "abc@xyz.com");

$user2->signUp("Mark", "879789", "abcd@xyz1.com");
```

```
echo $user1->getName().'<br>';  
echo $user1->email.'<br>';  
echo $user2->getName().'<br>';  
?>
```

```
</body>
```

```
</html>
```

```
Jack  
abc@xyz.com  
Mark
```

Example 3:

```
<!DOCTYPE html>  
<html>  
<head>  
<title>Chapter 8</title>  
</head>  
  
<body>  
  
<?php  
  
class User{  
    /* Member variables */  
    var $name;  
        var $email;  
    var $password;  
  
    /* Member functions */  
    function __construct($uname, $upassword, $uemail){  
  
        $this->name = $uname;  
        $this->password = $upassword;  
        $this->email = $uemail;  
  
    }  
}
```

```
function getName()
{
return $this->name;
}

}

$user1 = new User("Jack", "12345", "abc@xyz.com");
$user2 = new User("Mark", "879789", "abcd@xyz1.com");

echo $user1->getName().'<br>';
echo $user1->email.'<br>';
echo $user2->getName().'<br>';
?>

</body>

</html>
```

```
$user1 = new User("Jack", "12345", "abc@xyz.com");
```

Solution:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 8</title>
</head>

<body>

<?php

class Item{
    /* Member variables */
    var $name;
        var $price;
    var $category;

    /* Member functions */
    function __construct($iname, $iprice, $icategory){

        $this->name = $iname;
        $this->price = $iprice;
        $this->category = $icategory;
    }

    function getCategory()
    {
        return $this->category;
    }
}

$item1 = new Item("TV", "400", "Electronics");
$item2 = new Item("Table", "200", "Furniture");

echo $item1->getCategory().'<br>';
echo $item2->getCategory().'<br>';
?>

</body>

</html>
```

Chapter 9: Object Oriented PHP (Part 2)

Example 1:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 9</title>
</head>

<body>

<?php

class Item
{
    var $name;
    function setName($name)
    {
        $this->name = $name;
    }

    function getName()
    {
        return $this->name;
    }
}

class Laptop extends Item
{
    var $price;
    function setPrice($price)
    {
```

```

        $this->price = $price;
    }

    function getPrice()
    {
        return $this->price;
    }
}

$laptop1 = new Laptop;

$laptop1->setName("Sonny Laptop");
$laptop1->setPrice(450);

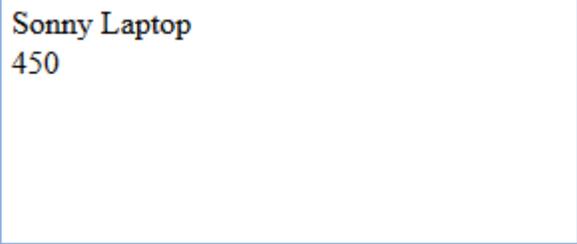

echo $laptop1->getName().'<br>';
echo $laptop1->getPrice();

?>

</body>

</html>

```

Sonny Laptop
450

Example 2:

```

<!DOCTYPE html>
<html>
<head>
<title>Chapter 9</title>
</head>

<body>

<?php

class Item
{
    var $name;

```

```

function setName($name)
{
    $this->name = $name;
}

function getName()
{
    return $this->name;
}
}

class Laptop extends Item
{
    var $price;
    function setPrice($price)
    {
        $this->price = $price;
    }

    function getPrice()
    {
        return $this->price;
    }

    function getName()
    {
        return "this is a child function";
    }
}

$laptop1 = new Laptop;

$laptop1->setName("Sonny Laptop");
$laptop1->setPrice(450);

echo $laptop1->getName().'<br>';
echo $laptop1->getPrice();

?>

</body>

</html>

```

this is a child function
450

Example 3:

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 9</title>
</head>

<body>

<?php

class Item
{
    var $name;
    function setName($name)
    {
        $this->name = $name;
    }

    function getName()
    {
        return $this->name;
    }
}

class Laptop extends Item
{
    var $price;
    function __construct($name, $price)
    {
        Item::setName($name);
        $this->price = $price;
    }

    function getPrice()
    {
        return $this->price;
    }
}
```

```

    }

}

$laptop1 = new Laptop("Sonny", 120);

echo $laptop1->getName().'<br>';
echo $laptop1->getPrice();

?>

</body>

</html>

```

Example 4:

```

<!DOCTYPE html>
<html>
<head>
<title>Chapter 9</title>
</head>

<body>

<?php

class Item
{
    var $name;
    public static $price;
    function setName($name)
    {
        $this->name = $name;
    }

    function getName()
    {
        return $this->name;
    }
}

$item1 = new Item;
$item1->setName("Cell Phone");
Item::$price = 500;

```

```
echo $item1->getName().'\<br>';  
echo Item::$price;  
  
?>  
  
</body>  
  
</html>
```

Solution

```
<!DOCTYPE html>  
<html>  
<head>  
<title>Exercise 9</title>  
</head>  
  
<body>  
  
<?php  
  
class Shape  
{  
    var $name;  
    function setProperties($name)  
    {  
        $this->name = $name;  
    }  
  
    function getName()  
    {  
        return $this->name;  
    }  
}  
  
class Square extends Shape  
{  
    var $width, $height;  
  
    function __construct($name, $width, $height)  
    {  
        Shape::setProperties($name);  
        $this->width = $width;  
        $this->height = $height;  
    }  
}
```

```
    }  
    function getWidth()  
    {  
        return $this->width;  
    }  
    function getHeight()  
    {  
        return $this->height;  
    }  
}  
  
$square = new Square("Square Shape", 40, 30);  
echo $square->getName().'<br>';  
echo $square->getHeight().'<br>';  
echo $square->getWidth();  
  
?>  
  
</body>  
  
</html>
```

Chapter 10: Understanding GET and POST Methods

Example 1:

Create an HTML page with following content.

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 10</title>
</head>

<body>

<form action="http://localhost/test.php" method="get">
<input type="text" name="pname" placeholder="Product Name"></input><br/>
<input type="text" name="pprice" placeholder="Product Price"></input><br/>
<input type="text" name="pcat" placeholder="Product Category"></input><br/>
<input type="submit" name="submit" value="Submit"></input>
</form>

</body>

</html>
```

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 10</title>
</head>

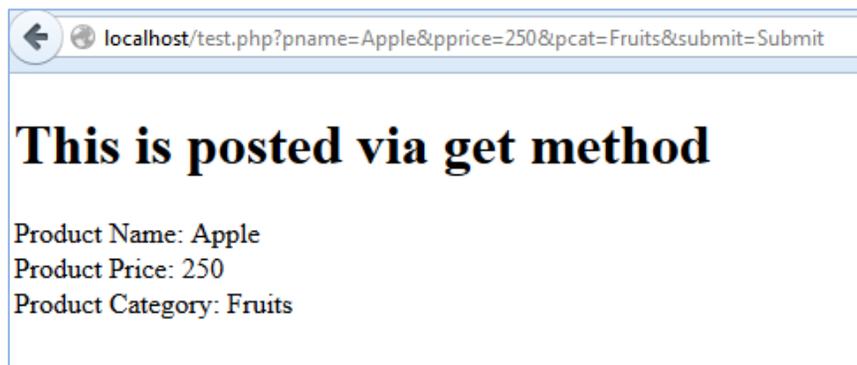

<body>

<h1>This is posted via get method</h1>
<?php
if( $_GET["pname"] || $_GET["pprice"] || $_GET["pcat"])
{
echo "Product Name: ". $_GET['pname']. "<br />";
echo "Product Price: ". $_GET["pprice"]. "<br />";
echo "Product Category: ". $_GET["pcat"];
}
?>

</body>

</html>
```

Apple
250
Fruits
<input type="submit" value="Submit"/>

Example 2:

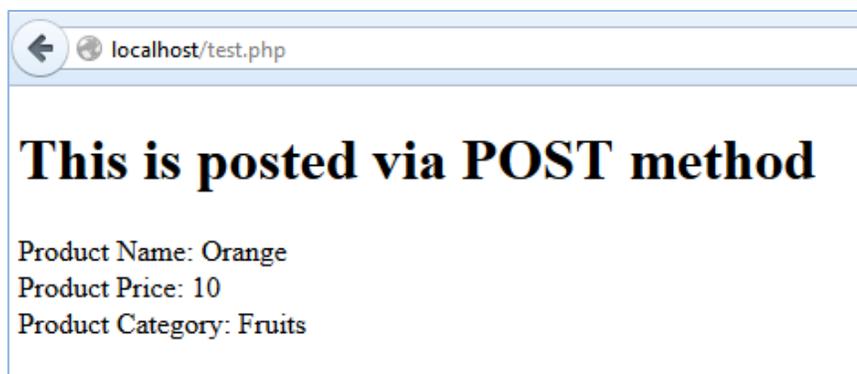

```
<form action="http://localhost/test.php" method="post">
<input type="text" name="pname" placeholder="Product Name"></input><br/>
<input type="text" name="pprice" placeholder="Product Price"></input><br/>
<input type="text" name="pcat" placeholder="Product Category"></input><br/>
<input type="submit" name="submit" value="Submit"></input>
</form>
```

```
<!DOCTYPE html>
<html>
<head>
<title>Chapter 10</title>
</head>

<body>

<h1>This is posted via POST method</h1>
<?php
if( $_POST["pname"] || $_POST["pprice"] || $_POST["pcat"])
{
echo "Product Name: ". $_POST['pname']. "<br />";
echo "Product Price: ". $_POST["pprice"]. "<br />";
echo "Product Category: ". $_POST["pcat"];
}
?>
</body>

</html>
```

Solution

Form Page

```
<!DOCTYPE html>
<html>
<head>
<title>Exercise 10</title>
</head>

<body>

<form action="http://localhost/salary.php" method="post">
<input type="text" name="name" placeholder="Name"></input><br/>
<input type="text" name="salary" placeholder="Salary"></input><br/>
<input type="submit" name="submit" value="Submit"></input>
</form>

</body>

</html>
```

salary.php

```
<!DOCTYPE html>
<html>
<head>
<title>Exercise 10</title>
</head>

<body>

<?php
if( $_POST["name"] || $_POST["salary"])
{
echo "Name: ". $_POST['name']. "<br />";
echo "Salary: ". $_POST['salary']. "<br />";

$bonus = $_POST["salary"]/10;
echo "Bonus on Salary: ". $bonus;
}
?>
</body>
```

```
</html>
```

Other Books by the Author

C# Programming for Beginners

<http://www.linuxtrainingacademy.com/c-sharp>

C# is a simple and general-purpose object-oriented programming language. Combine this with its versatility and huge standard library it's easy to see why it's such a popular and well-respected programming language.

When you learn how to program in C# you will be able to develop web based applications or graphical desktop applications. One of the best things about C# is that it's easy to learn... especially with this book.

Java Programming

<http://www.linuxtrainingacademy.com/java-programming>

Java is one of the most widely used and powerful computer programming languages in existence today. Once you learn how to program in Java you can create software applications that run on servers, desktop computers, tablets, phones, Blu-ray players, and more.

Also, if you want to ensure your software behaves the same regardless of which operation system it runs on, then Java's "write once, run anywhere" philosophy is for you. Java was design to be platform independent allowing you to create applications that run on a variety of operating systems including Windows, Mac, Solaris, and Linux.

JavaScript: A Guide to Learning the JavaScript Programming Language

<http://www.linuxtrainingacademy.com/javascript>

JavaScript is a dynamic computer programming language that is commonly used in web browsers to control the behavior of web pages and interact with users. It allows for asynchronous communication and can update parts of a web page or even replace the entire content of a web page. You'll see JavaScript being used to display date and time information, perform animations on a web site, validate form input, suggest results as a user types into a search box, and more.

Scrum Essentials: Agile Software Development and Agile Project Management for Project Managers, Scrum Masters, Product Owners, and Stakeholders

<http://www.linuxtrainingacademy.com/scrum-book>

You have a limited amount of time to create software, especially when you're given a deadline, self-imposed or not. You'll want to make sure that the software you build is at least decent but more importantly, on time. How do you balance quality with time? This book dives into these very important topics and more.
